V0 - 04th Aug 2022	Cecilia Mascia, Francesca Frexia (CRS4)		First version: description of the first version of the mapping at the end of the EOSC-Life WP1 Demonstrator “Cloudification of BBMRI-ERIC CRC- Cohort and its Digital Pathology Imaging” (APPID 1228)

Context

This document describes the semantic model, expressed in openEHR format¹, for the clinical data included in the Colorectal Cancer Cohort (CRC-Cohort) dataset included among the available collections in the BBMRI-ERIC Directory². The CRC-Cohort is a collection of clinical data and digital high-resolution digital pathology images pertaining to tumor cases. The collection has been assembled from a number of participating biobanks and other partners through the ADOPT BBMRI-ERIC project(H2020-INFRADEV-3-2015)³.

The modelling has been started within the EOSC-Life WP1 Demonstrator “Cloudification of BBMRI-ERIC CRC-Cohort and its Digital Pathology Imaging” (APPID 1228), which had among its objectives the improvement of the interoperability and reusability of the CRC-Cohort dataset.

Mapping

Method

This section reports the mapping between the XSD model of the CRC cohort dataset and the new openEHR model (CRC_cohort template, semantic version:19.0.0) specifically designed to accommodate this data⁴. After a preliminary selection of possibly relevant archetypes from the openEHR Clinical Knowledge Manager, the different attributes of each element of the source model – i.e. meaning, datatype, cardinality, allowed values, etc. – have been analysed in order to find a proper

correspondence with archetypes' nodes. Archetypes were then assembled to form the template.

When defined, mapping descriptors are embedded in the template for each node and for each assumable value in the form of key-value pairs that could be processed automatically during conversion as “annotations”.

```
<annotations path="[openEHR-EHR-COMPOSITION.report.v1]/content[openEHR-EHR-SECTION.demographics_rcp.v1 and name/value='Patient data']/items[openEHR-EHR-EVALUATION.gender.v1]/data[at0002]/items[at0019]">

  <items id="Data model label">SEX</items>
  <items id="XSD type">tag</items>

```

Listing 1 - Template annotation

To support semantic interoperability, we leverage on the openEHR possibility to bind external terminologies to data nodes and values. Therefore, model and data instances are further enriched by associating concepts from the OMOP⁵ standard vocabulary (available via the ATHENA [repository](#)). These mappings of the assumable values exist both in the template and the final data instance. In fact, at the template level, it is possible to restrict the possible values for a node to a predefined list, where OMOP concept IDs can be added (in the example, “Female”, “Male” and “Other”) and used afterwards in the data instance (see Table 1). In this way, it is possible to query the CDR to ask, for instance, “records where the biological sex is equal to 8532 (Female)” (see Listing 2).

- The possible choices should be normalised to the allowed values in the template (TRUE or FALSE).

Molecular markers - KRAS mutation status

Notes:

At the moment, there is not a perfect correspondence between the allowed values for the fields in this section. Given that the chosen archetype allows to express the presence/absence of a variant, we adopted the following mapping: Not mutated → Absent; Mutated → Present; Not done → Indeterminate
